FAQ's on Grooving Machines

- Two off custom built runway grooving machines
- Each Machine can groove 1.65 mtrs in width per pass, optimising capability of producing high volume of square metreage per shift.
- Environmentally friendly, uses minimum water which in turn means minimum production of slurry. Therefore our water tanker and slurry tanker will only require one fill up and one dump to give maximum performance per shift.
- State of the art multi vac system to ensure optimal clean surface as possible whilst grooving.
- Has a point and laser guided system to ensure accuracy of cutting widths and grooving alignment,
- Machine is fitting with a floating shaft, laser guided and sensors on shaft for controlling accuracy of cutting depth at all times.
- Machine is transported to site by a Prime Mover, it works independently on site, if anything fails on the machine, it does not require a float to be removed from site, therefore there will not be any issues if drive motors on machinery fail and you can not load onto a float. Unlike other machines this machine can simply be hitched by prime mover and driven off site, which reduces risk.
